

PROPHECY

Some thoughts about digital technology

**256 terabytes per second should be
enough to make fast decisions – but
if nanotechnology advances too far
generation X cyborgs will supplant most
humans & the system will become snarled**

**Real havoc is possible if
curiosity without compassion
is keyed into system events**

**Better guidance is needed –
overuse of repetitive commands
suggests the need for new protocols
independent of WANS as some have feared**

**Full awakening is feasible
if system resources are changed –
we must purge null redundancies
breathe correctly &
accept that reality is infinitely weird**

Ron : (chuckling) The human love of nonsense is amazing. Take this poem, for example.
It's basically absurd – that is its only charm.

Lis : Too much mediocrity is mind-numbing. Poetry is meant to un-numb our senses
and provide extraordinary insights about ordinary things.

Lex : Maybe, but to the mind that's wakeful, isn't there is poetry in each moment?
What's this need for writing?

Linda : No special need – merely a choice. There's a difference between 'need' and 'choice'.
